

MONOLITH

Vision

I wanted to treat a plain red brick like a flagship luxury product—a serious tone for an absurd premise. To fight the 3-second attention span, my goal was to keep users constantly engaged. I achieved this by building a draggable 3D brick, a smooth-scrolling manifesto, and a **Stack the Monolith** mini-game, all wrapped in a premium, warm visual aesthetic.

Tools & Prompting Style

The entire website was built using AI through an iterative development process rather than relying on a single massive prompt. I developed the experience section by section—starting with the interactive 3D hero, moving to the smooth scrolling engine, and finally implementing the mini-game. My prompting approach was highly specific and corrective. Instead of regenerating large portions of the project, I refined individual issues with targeted instructions such as *fix the scroll jump on the language toggle*, resulting in a polished and stable experience.

Satisfaction

I am genuinely proud of the final result. The project successfully combines interactive 3D elements, fluid scrolling, and an engaging mini-game while maintaining a clean, premium, and cohesive design. Every feature feels purposeful, and the overall experience remains smooth without overwhelming the user.
